Mobile-based Oral Screening and Referral Support Tool (Project Summary)

Objective:
To evaluate the usefulness of a mobile-based tool in supporting early identification of suspicious oral changes and encouraging timely clinical consultation.

Nature of Tool:
A screening support aid (not a diagnostic tool) that analyzes guided oral photographs using AI and combines this with basic exposure history (e.g., tobacco use) to provide referral guidance.

Intended Use:
- For patients to use at home using a mobile phone
- To support awareness and early referral decisions
- Not a substitute for clinical examination or diagnosis

Data & Privacy:
- All processing happens locally on the mobile device
- No images or patient data are uploaded to any server
- Users may optionally share a generated PDF report with clinicians

Proposed Evaluation:
- Small, controlled, observational use alongside routine clinical examination
- Limited pilot with consenting patients
- No intervention; clinician judgment remains primary

Financials:
- No financial implication for the institute
- Tool is completely free to use

Status:
- Currently in validation phase
- Intended for early referral guidance only
